# Interactive pedagogical programs based on constraint grammar

Lene Antonsen, Saara Huhmarniemi, Trond Trosterud

#### Abstract

We here present a set of interactive parser-based CALL programs for North Sámi. The programs are based on a finite state morphological analyser and a constraint grammar parser which is used for syntactic analysis and navigating in the dialogues. The analysers provide effective and reliable handling of a wide variety of user input. In addition, relaxation of the grammatical analysis of the user input enables locating grammatical errors and reacting to the errors with appropriate feedback messages.

#### Background and pedagogical motivation

The pedagogical programs in OAHPA! are based upon three pre-existing language technology resources developed at the University of Tromsø: a morphological analyser/generator, a CG parser for North Sámi and a number word generator compiled with the Xerox compiler xfst.

The main goal of the development of OAHPA! was to develop a language tutoring system going beyond simple multiple-choice questions or string matching algorithms, with free-form dialogues and sophisticated error analysis. Immediate error feedback and advice about morphology and grammar were seen as important requirements for the program

#### Leksa — training the vocabulary

The pedagogical lexicon is used for vocabulary training as well as for grammatical training. Each Sámi lemma is translated into Norwegian or Finnish. The user may chose direction (to or from Sámi), and restrict the vocabulary according to the vocabulary of the most commonly used Sámi textbooks, or according to topic (e.g. food/drink, family, school, nature, ...). The program accepts a wide range of synonyms, but

#### Handling dialectical variation

When generating sentences or providing the correct answers for the user, we allow only normative forms in the chosen dialect. On the other hand, the live analyser used for the analysis of the user input accepts all correct dialect variants of the same grammatical word. We compile one normative but variation-tolerant transducer for analysing the input, and one strict one for each dialect for sentence generation

In the source code, forms are marked as missing in certain dialects (the default being that all forms occur in all dialects). Below is an example of dialectal variation in the comparative inflection. The resulting transducers give stuorát for the KI dialect and stuorit for the GG one, of the adjective stuoris "big"

+A+Comp:i%>X4b BUStem ; ! NOT-KJ +A+Comp:á%>X4b BUStem ; ! NOT-GG

### Numra — training numbers

The Numra game offers training on number expressions, either from number symbols to linguistic representation, or vice versa. As our only program, Numra offers training for four different Sámi languages, Kildin, Inari, North, Lule and South Sámi. We hope to extend our coverage to more languages for the other

#### Sentence generation in the QA game Vasta

One of the main goals of the programs in OAHPA! is to practice language in natural settings with variation in the tasks. In order to provide variation in programs that involve sentential context we implemented a sentence generator. The sentence generator is used in the morphology in sentential context program (Morfa-C), and for generating questions to the QA drill (Vasta)

#### Evaluation

The overall evaluation shows that the students answer correctly slight half of the time. By far the most popular program is the basic morphological drill (but the interactve programs have been logged for a couple of days only) The 322 logged Sahka errors are

- [	Program	Correct	Wrong	Total	96
ly	Morfa-S	6920	6323	13243	52.3
	Leksa	5659	4248	9907	57.1
	Numra	3086	2512	5598	55.1
	Morfa-C	1349	1613	2962	45.5
	Sahka	322	322	644	50.0
-	Vasta.	19	102	121	15.7
	Total	17355	15120	32475	53,44

Error type	#	Error type	#
no finite verb	85	wr. case for V-arg	22
orth, error	83	wr. case after Num	10
wrong S-V agr	46	wrong tense	9
no infinite V	30	no postposition	6
wrong V choice	24	wrong word	7

#### Conclusion

By using a sloppy version of the syntactical analyser for North Sámi, combined with a set of error-detection rules, we have been able to build a flexible CALL resource. The programs are modular, and the modules may be improved by adding more materials -- words, tasks, dialogues, levels, words from textbooks. The CG parser framework was originally chosen as parser framework for Sámi due to its extraordinary results for free-text parsing. The present project has shown that CG is well fit for making pedagogical dialogue systems as well.

### Pedagogical lexicon

The OAHPA! programs share a set of common resources: a pedagogical lexicon and a morphological generator that is used for generating the different word forms that appear in the programs. The dialectal variation is taken into account in the lexicon as well as in the morphology. The lexical entry for monni "egg" is given to the

```
<lemma>monni</lemma>
<pos class="N"/>
 egg
 muna
</translations>
<semantics>
 <sem class="FOOD-GROCERY"/>
</semantics>
<stem class="bisyllabic" diphthong="no"
gradation="yes" soggi="i" rime="0"/>
<dialect class="NOT-KJ"/>
<sources>
  <book name="d1"/>
  <book name="algu"/>
```

The morphological properties of words are used when making a detailed feedback on morphological errors. If the user does not inflect the lemma correctly, she can ask for hints about the inflection, and try once more, instead of getting the correct answer straight away.

## Morphological feedback

The feedback messages are determined by the combination of morphological features in the lexicon and the inflection task at hand. The morphological specification below gives a rule stating that there is a vowel change in illative singular for bisyllabic nouns that end with the vowel i. The corresponding feedback message instructs the user to remember the vowel change

```
"monni" has even-syllabic stem and shall have
strong grade. Vowel change i > á. the suffix -i.
```

<message id="i\_a">Vowel change i > a.

gets feedback from the machine. A correct answer gets green colour.

The system-internal representation of monn states it is a bisyllabic i-stem, which triggers i > á change in illative.

```
CG-parser in live analysis in the interactive programs Vasta and Sahka
```

We have chosen not to use multiple-choice, but rather let the student formulate her own answer. To a certain question one may give many kinds of acceptable answers. In Sámi one may change word order, and also add many kinds of particles.

We use a ruleset file which disambiguates the student's input only to a certain extent, because there will probably be grammatical and orthographic errors. The last part of the file consists of rules for giving feedback to the student's grammatical errors, and rules for navigating to the correct next question of in the dialogue, due to the student's answer.

The system question and student answer are analysed together, delimited by the boundary marker Aqst. They first get a morphological analysis (left), and are then disambiguated, and, if possible,

interpretation

ped-sme.cg3

The system asks "How old are you?"- The answer is analysed, and a regular expression is used to read the answer. Dependent upon the age span, the user is then directed to dfferent follow-up questions.

Navigating by regular expressions

Answer

```
# Picking the age
WWP (&dia-adult) TARGET Num (*-1 (D. LINK 0 (Man_boaris_don_leat))
WP (Adia-young) TARGET Num (*-1 OD. LINK 0 (Man_boaris_don_leat))
    (0 ("([1-9])"r));
<utt type="question" name="How_old_are_you">
  <text>Man boaris don leat?</text>
  <alt target="young" link="Do_you_go_to_school_young"/>
<alt target="child" link="Have_you_started_at_school_child"/>
  <alt target="adult" link="Do_you_work_adult"/>
<alt target="default" link="Do_you_work_adult"/>
```

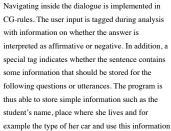

## "«Gude»" "guhte" Pron Interr Sg Acc "guhte" Pron Rel Sg Gen "guhte" Pron Rel Sg Acc "guhte" Pron Interr Sg Gen "«latnjii» "latnja" N Sg Ill "moots" 'mun" Pron Pers Dul Nom "bidjat" V TV Ind Prs Dul "bidjat" V TV Ind Prt Pl3 "mun" Pron Pers Sgl Gen "mun" Pron Pers Sgl Acc "TV" N ACR Sg Acc "TV" N ACR Sg Non "TV" N ACR Sg Gen ahka" QDL gosa\_bidjat\_TV N Prop Plc Sg Ill un" Pron Pers Dul Nom oa" N Prop Plc Sg Ill "TV" N ACR Sg Acc "TV" N ACR Sg Nom "TV" N ACR Sg Gen "<hivssegis>" "hivsset" N Sg Nom PxSg3 'hivsset" N Sg Acc PxSg3 \*<->\*. CL8

The CG-rules disambiguate and add grammar-error-tag (&grm-missing-Ill) and navigation-tag (&dia-hivsset):

```
"auhte" Pron Interr Sa Acc &arm-missing-Ill
 "latnja" N Sg Ill
"<moai>"
       mun" Pron Pers Dul Nom
      "bidjat" V TV Ind Prs Dul
       mun" Pron Pers Sgl Gen
       TV" N ACR Sg Acc
       ^sahka" QDL gosa_bidjat_TV &dia-hivsset
      "mun" Pron Pers Dul Nom
 "bidjat" V TV Ind Prs Du1
"<TV"
"TV" N ACR Sg Gen
  "<hivssegis>"
"hivsset" N Sg Loc
"<.>"
"." CLB
```

### Navigation

in tailored utterances

In the example to the left the question is "In which room do we put the TV?" One of the alternatives for the navigation is due to the target tag being assigned because of the lemma hivsset ("WC"). The answer will be "That is not a good idea. Make a new try." The CG-rule:

```
MAP (&dia-hivsset) TARGET QDL IF (0 (gosa_bidjat_TV))
(*1 ("hivsset") BARRIER ROOMS) ;
```

There are alternative links in the dialogue, one of them is due to the &dia-hivsset tag:

```
utt type-"question" name-"goso_bidjot_TV">
<text>Gude lotnjii moai bidje mu TV?</text>
<olt target-"hivsset" links-"goso_bidjot_TV">
<text>Dot gal ii heive! Geohččal oddosit.</text>
```

Every question has its own unique id, which is used in navigating between questions. In addition, the CG-rules may be tailored for specific questions, like in the rule above.

Age-tags are assigned with help of regex-rules to the answer to the question "How old are you?". The tags function as links for moving to the next dialogue branch tailored to student's age.
